No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Diagnosing cancer comprises detecting stratum corneum chymotrypsin enzyme.

Claim 25; Page 113; 127pp; English.

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel method for vaccinating an individual against stratum corneum chymotrytic enzyme (SCCE), comprising inoculating an individual with a SCCE peptide, which elicite an immune response in the individual with a SCCE peptide, which elicite an immune response in the individual. A peptide of the invention acts as a stratum corneum chymotrytic enzyme inhibitor. The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligonucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or paptides are also useful in the monitoring and development of immunotherapies for ovarian and other malignancies. The present sequence the prepresents a peptide fragment of serine protease SCCE (stratum corneum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of stratum corneum chymotrytic enzyme (SCCE) peptides, for vaccinating an individual against SCCE, and in monitoring and developing immunotherapies for ovarian and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                                Human stratum corneum chymotrytic enzyme peptide fragment SEQ ID NO:80.

Isolated NOVX polypeptides and nucleic acids, useful for preventing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    N-PSDB; ADN62901
           The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit comprising, in one or more
containers, the composition described above; (3) an isolated nucleic acid
molecule which encodes a NOVX protein of the invention; (4) a vector
comprising the above vector; (6) an antibody that immunospecifically
binds to the polypeptide described above; (5) a cell
comprising the nucleic acid molecule above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
ca disease associated with altered levels of expression of the above
polypeptide or nucleic acid molecule in a first mammalial subject; (9) a
method of identifying an agent that binds to the polypeptide described
above; (10) a method for identifying a potential therappeutic agent for
ca berrant physiological interactions of the polypeptide; (11) a method of
above; (10) a method for identifying a potential therappeutic agent for
aberrant physiological interactions of the polypeptide; (11) a method of
ca deminating a pathology associated with the polypeptide; (12) a method for modulator of
ca pathology associated with the polypeptide; (12) a method for modulating
cor preventing a pathology associated with the above polypeptide; Novy
sequences have antidabetic, anorectic, antibacterial, vircide,
immunomodulator, cytostatic, noorectic, antibacterial, vircide,
cor preventing a pathology associated with the above polypeptide or the nucleic
cor preventing a pathology associated with the above polypeptide or mediating
cor preventing or profestatic, anorectic, antibacterial, vircide,
and antilipaemic activities, and can be used in gene therapy. The
and antilipaemic activities, and can be used in gene therapy.
Cor propertied is useful in manufacturing a medicament for treating a
corid molecule may be used to diagnose, treat or prevent mecabolic

The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the abberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX polypeptides and activity of NOVX by supplementing the patient our controlled with decreased expression or to rectify mutations. Conversely, antiense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX binding with the cells own genes and preventing their expression. NOVX binding with the cells own genes and preventing their expression. NOVX binding with the cells own genes and preventing their expression. NOVX binding with the cells own genes and preventing their expression. NOVX probables and complementary sequences may also be used as DNA probables in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of the production of antibodies and in assays to identify modulators captive of the expression and activity of NOVX. The anti-NOVX polypeptide antibodies, agonists and antagonists may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX colypeptides and polypeptide antibodies may be used in this way to prevent, diagnose and treat: metabolic disorders, inmune disorders, disorders, and the various dyslipidaemia, metabolic disorders, inmune disorders, may also be used as disorders, and disorders, and the various dyslipidaemia metabolic captive disorders.
diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               They may also be used as antibacterial agents. The present sequence represents the amino acid sequence of a human NOVX protein.
                                                            Claim 1; SEQ ID NO 98; 395pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 181 AA;

ö

obesity, ö New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, cancer or dyslipidemia, and in chromosome mapping, tissue typing pharmacogenomics

Claim 1; Page 170; 586pp; English.

The present invention describes NoVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide

codescribed above and a carrier; (2) a kit comprising a polypeptide

containers, the composition described above; (3) an isolated nucleic acid

containers, the nucleic acid molecule described above; (5) a cell

comprising the nucleic acid molecule described above; (6) a vector

comprising the above vector; (6) an antibody that immunospecifically

binds to the polypeptide described above; (7) methods for determining the

comprising the above vector; (6) an antibody that immunospecifically

binds to the polypeptide described above; (7) methods for determining the

comprising the above vector; (6) an antibody that immunospecifically

comprising the above vector; (6) an antibody that immunospecifically

considered with altered levels of expression of the above

confidentifying an adent that binds to the polypeptide described

above; (10) a method for identifying a potential therapeutic agent for

constant physiological interactions of the polypeptide; (11) a method of

constant physiological interactions of the polypeptide; (11) a method of

constant physiological interactions of the polypeptide; (11) a method of

constant physiological interactions of the polypeptide; (12) a method for modulating

constant physiological interactions of the polypeptide; (12) a method of

constant physiological interactions of the polypeptide; (12) a method of

constant physiological interactions of the polypeptide; (12) a method of

constant physiological interactions of the polypeptide; (13) method of

constant physiological interactions of the polypeptide; (12) a method of

constant physiological interactions of the polypeptide; (12) a method of

constant physiological interactions of the polypeptide; (13) method of

constant physiological interactions of the polypeptide; (13) method of

constant physiological interactions of the polypeptide; (13) method of

constant physiological interac

The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX by supplementing the patient our polynucleotides may be used to treat disorders associated with decreased expression or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX colymelection of complementary sequences may also be used as DNA probbes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of constructive therapy. NOVX polypeptides may also be used as antigons in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NOVX. The used to modulate NOVX polypeptide antibodies may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX colypeptides may be used in this way to prevent. Citagnose and treat: metabolic disorders, inthis way to prevent. Citagnose and treat: metabolic disorders, obesity, infectious disease, anorexia, cancer, cancer-associated cachexia, neurodegenerative dissorders, immune disorders, immune disorders, immune disorders, immune disorders, immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Dipippo VA;

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell of presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) and sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above copypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for a berrant physiological interactions of the polypeptide; (11) a method of a pathology that is related to an aberrant expression or comparation and alternation and above; (11) a method of a pathology associated with the polypeptide; (12) a method of modulation to a pathology associated with the polypeptide; (12) a method of modulation to the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide or the nucleic and antilipaemic activities, and can be used in gene therapy. The copypeptide is useful in manufacturing a medicament for treating a pathology associated with a human disease. The polypeptide or the nucleic syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic acid molecule may be used to diagnose. The polypeptide or parent metabolic disorders such as diabetes such as diabetes or obesity, infections, cancer; or probes, in chromosome mapping, itsue

The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides and cativity of NOVX polypeptides and cativity of NOVX polypeptides and complementations. Conversely, antisense NA molecules expression or activity of NOVX by supplementing the patient our crediffy mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX colymuclocides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators capcustive therapy. NOVX polypeptides may also be used as antigens in the production of antibodies, agonists and antagonists of the expression and activity of NOVX. The arti-NOVX polypeptide antibodies may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX colypeptides and polymucleotides may be used in this way to prevent, diagnose and treat: metabolic disorders, inmune disorders, disorders, allowed cachexia, neurodegenerative disorders, and the various dyslipidaemias, metabolic disorders, and the various dyslipidaemias, metabolic manner and the various diseases and various cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                   Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 They may also be used as antibacterial agents. The present sequence represents the amino acid sequence of a human NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98600). TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15
                                                                                                                                                                                                                                                                                                                                                                                         Novel extracellular serine protease, termed tumor antigen-derived gene 1
protein overexpressed in carcinomas and DNA encoding it, for diagnosis,
treatment, prevention of cancer, particularly breast, ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        immunomodulator; cytostatic; nootropic; neuroprotective;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protease family and its corresponding nucleic acid sequence. PS133 polypeptide is useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating or determining predisposition to diseases or conditions of the prostate such as prostatic cancer. The present sequence is the human stratum corneum chymotrypsin protein. This sequence is used to align with PS133 consensus protein.
Protein purification; PS133 protein; serine protease; prostate disease; andrology; genitourinary disease; prostatic cancer; cytostatic; protein therapy; chymotrypsin; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to PS133 protein, a member of the human serine

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or

Claim 1; Page 172; 586pp; English.

The present invention describes NoVX proteins, where X can be 1 to 55

(e.g. NOVI). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit comprising, in one or more
containers, the composition described above; (3) an isolated nucleic acid
molecule which encodes a NOVX protein of the invention; (4) a vector
comprising the nucleic acid molecule described above; (5) a cell
comprising the above vector; (6) an antibody that immunospecifically
binds to the polypeptide described above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
sample; (8) methods for determining the presence of or predisposition to
a disease associated with altered levels of expression of the above
comprising a pathology that is frem ammalian subject; (9) a
method of identifying an agent that binds to the polypeptide described
above; (10) a method for identifying a potential therapeutic agent for
ca berrant physiological interactions of the polypeptide; (11) a method of
correct the activity of the polypeptide described above; (12) a method of
correcting for a modulator of activity or of latency or predisposition to
correct the activity of the polypeptide described above; (13) methods of traating
corrected have antidiabetic, anotectic, antibacterial, virucide,
corrected have antidiabetic, noncopic, antibacterial, virucide,
corrected have antidiabetic, noncopic, antibacterial, retrapary. The
corrective and antilipaemic activities, and can be used in gene therapy. The

                nucleic
polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to disquose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dyslipidaemias. The nucleic acids can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NOVX from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated NOVX polypeptides and polynucleotides. NOVX polypeptides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and polynucleotides may be used to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polymucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X;

The anti-NOVX polypeptide antibodies, agonists and antagonists may also be used to modulate NOVX polypurclectide expression and activity of NOVX polypeptides. The anti-NOVX polypeptide antibodies may also be used alagnostic agents for detecting the presence of NOVX in samples. NOVX polypeptides and polynuclecting the presence of NOVX in samples. NOVX polypeptides and polynuclectides may be used in this way to prevent,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1; SEQ ID NO 102; 395pp; English.

The present invention describes NoVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising on or more containers, the composition described above; (3) an isolated nucleic acid molecule described above; (5) a coll comprising the nucleic acid molecule described above; (5) a cell composition the nucleic acid molecule above; (5) a cell comprising the nucleic acid molecule above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a disease associated with altered levels of expression of the above corrected acid molecule in a first mammalian subject; (9) a method for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for a bove; (10) a method for identifying a potential therapeutic gent for other above; (10) a method of cartivity of the polypeptide above; (12) a method of correctivity of the polypeptide described above; (13) methods for modulating the activity of the polypeptide described above; (13) methods of treating or preventing a pathology that is related to an aberrant expression or aptropendic and untilipaemic activities, and can be used in gene therapy. The collypeptide is useful in manifectual a medicament for treating a pathology associated with the above polypeptide in and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manifectual a medicament for treating and antilipaemic activities, and can be used in gene therapy. The cold molecule may be used to observe, infercion, cachexia, cachexia and activity of disease, immune disease or besity, infection, cachexia, cachexia, immune disease and a shitchmark and a poly

The invention relates to isolates and your perpetuses and polymention relates to the invention relates to isolates are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NovX polypeptides and complements. For example, NovX polypeptides and polymucleotides may be used to treat disorders associated with decreased complementary sequences associated with decreased expression or activity of NoVX by supplementing the patient our complementary sequences may also be used as DNA binding with the cells own genes and preventing their expression. NoVX polymetic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of complementary sequences may also be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NoVX. The anti-NoVX polypeptide antibodies may also be used as disorders. Althormer's and polypeptides antibodies may also be used as disorders, cancer, cancer, cancer-associated cachexia, neurodegenerative disorders, and the various dyslipidaemias, metabolic disorders, and the various dyslipidaemias, metabolic calenter and paralled services and various disorders associated with obesity, the metabolic syndrome X and complements and the various displaces and error and the various dyslipidaemias, metabolic cachers. The present of th present sequence They may also be used as antibacterial agents. The present represents the amino acid sequence of a human NOVX protein. 100.0%; Score 50; DB 8; Length 250; 100.0%; Pred. No. 2.7; Query Match Best Local Similarity

obesity, New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, cancer or dyslipidemia, and in chromosome mapping, tissue typing pharmacogenomics.

Claim 1; Page 170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector

comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aborrant physiological interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide, (12) a method for modulating the activity or the polypeptide described above; (13) methods of treating or pathology associated with the above polypeptide. Novx equences have antidiabetic, anorectic, antibacterial, virucide, immunomodulator, cytostatic, noctropic, neuroprotective, antiparkinsonian corrections associated with a human disease. The polypeptide or the nucleic syndrome associated with a human disease. The polypeptide or prevent metabolic corrections, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's cidisease immune disorders, haematopoletic disorders and various corrections, inchromosome mapphing, tissue typing, preventive medicine and cypoletic acids can also be used as hybridisation corrections, themselves and cold sorders and antipartice. The present sequence represents a human NoVX from the consent inchromes and acids can also be used to be properticed as the propertice. present invention 8899999999999999999999999999

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

B21863
Itistace kallikrein (EC 3.4.21.35) S1, submaxillary - rat (fragment)
N.Alternate names: glandular kallikrein; kininogenin
C.Species: Rattus norvegicus (Norway rat)
C.Species: Rattus norvegicus (Norway rat)
C.Species: Rattus norvegicus (Norway rat)
C.Species: Rattus norvegicus
C.Socossion: B23863

tissue kallikrein (EC 3.4.21.35), prostatic - guinea pig
NyAlternate names: glandular kallikrein
C;Species: Cavia porcellula (guinea pig)
C;Date: 08-Mar-1989 #sequence_revision 08-Mar-1989 #text_change 09-Jul-2004
C;Accession: A27207
R;Dunbar, J.C.; Baradshaw, R.A.
Biochemistry 26, 3471-3478, 1987
A;Title: Amino acid sequence of guinea pig prostate kallikrein.
A;Reference number: A27207; MUID:88000549; PMID:3307909
A;Accession: A27207
A;Residues: 1-239 *CUNA
A;Cross-references: UNIPROT:P12323; UNIPARC:UPI000012DEE2
A;Cross-references: UNIPROT:P12323; UNIPARC:UPI000012DEE2
A;Note: 50-Trp was also found
C;Superfamily: trypsin; trypsin; homology
C;Keywords: hydrolase; serine proteinase
F;1-231/Domain: trypsin; homology 

C;Superfamily: trypsin; homology

                                                              Isolde-19862-2; Sequence=vSP_013581;
TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Also expressed in the brain, mammary gland, cerebellum, spinal cord and kidney. Lower levels in salivary glands, uterus, thymus, thyroid, placenta, trachea and testis. Up-regulated in ovarian carcinoma, especially late-stage serous carcinoma, compared with normal ovaries and benign adenomas (at the protein level).

INDUCTION: By estrogens and glucocorticoids in a breast carcinoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Clements J.A.;
"Tissue-specific expression patterns and fine mapping of the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         kallikrein (KLK) locus on proximal 19q13.4.";
J. Biol. Chem. 275:37397-37406(2000).
-!- SUBCELLULAR LOCATION: Secreted (Probable).
-!- TISSUB SPECITOTY: High expression in brain, bone marrow and fetal liver. Also expressed in liver, pancreas, fetal spleen, prostate and skeletal muscle.
-!- SIMILARITY: Belongs to the peptidase S1 family. Kallikrein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                           Sequence 2. Application US/08930188

Patent No. 6093337

GENERAL INFORMATION:

APPLICANT: Dixon, Eric P.

APPLICANT: Little, Sheila P.

ITILE OF INVENTION: AMYLOID PRECURSOR PROTEIN PROTEASE AND TITLE OF INVENTION: RELATED NUCLEIC ACIDS

NUMBER OF SEQUENCES: 3

CORRESPONDENCE S: 3

CORRESPONDENCE BILLILLY COMPANY

STREET: Lilly Corporate Center

CITY: Indianapolis

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
